PROFILE

I started programming in 2018 in a technical high school, and I have been working as a programmer since the end of 2021. I have always been passionate about technology and programming, initially fascinated by the power that programming alone gives us, and later by the way we design, build, and maintain software, applying the necessary business rules and impacting our clients' lives. I am also driven by challenges, work, and goals, and I am constantly developing myself with books, SaaS projects, and courses to become a more well-qualified professional. Portfolio: <https://portfolio-dhominirabelos-projects.vercel.app/>

SKILLS

I'm a versatile developer with a great facility for quickly learning new tools and technologies. Always open to new challenges, I adapt quickly and focus on delivering effective results, regardless of the tools required.

- **Languages:** Typescript, Javascript, and Python.
- **Mobile:** React Native.
- **Back-end:** Node, Nest, Express, Flask, FastAPI and Django.
- **Front-end:** React and Next.
- **Back-end Tools:** Redis, Mongo, Postgres, Pytest, Jest, and Docker.
- **Front-end Tools:** Axios, Zod, Zustand, Tailwind, and Styled-components.
- **AWS:** DynamoDB, SQS, Cognito, Lambda, etc.
- **Concepts:** Clean Code, SOLID, Design Patterns, DDD, Clean Arch, and TDD.
- **Soft Skills:** Adaptability, Agile methodology, Analytical thinking, Communication, Fast learning, High code standardization, Organization, Proactivity, and Team management.

EXPERIENCES

MCTECH | 03/2025 - PRESENT

- Web development of a system for monitoring and analyzing machine performance in industries using agile methodology, building the front-end with React. Back-end with Typescript and Nest, as well as other tools such as Docker, Postgres, Git, etc.
- I fully developed version 2 of the project's main web server, using my learnings and studies on DDD, Clean Architecture, Clean Code, OOP, SOLID, and TDD. Creating code that is consistent, secure, tested, scalable, readable, easy to maintain and that really implements the business rules, which solved the main problem of version 1 which was a tremendous technical debt and a system with many problems to maintain. This new software has increased the company's turnover, as it can now sell a better, more complete solution that works perfectly.
- I actively participated in planning meetings to develop functionalities and integrations. At the end of the development of the most difficult functionalities, I presented the results, behaviors, and performance.
- Monitoring data and behaviors in real time, such as connection status, operation and parameters.
- Implementing dozens of extremely complex business rules for the industrial sector, orchestrating interaction between dozens of entities, with dynamic behavioral logics and performance criteria.
- I used RabbitMQ and an API Gateway to integrate with other microservices in the system, such as the data collection and monitoring microservice, ensuring consistency, scalability and security.
- Creation of websockets to monitor connections, data and performance in real time, implementing all possible events.
- Development of integration with a websocket on the application's front-end to display data in real time, taking into account possible events. In addition to developing some screens and functionalities for the front-end.

OXBYKES | 08/2024 - 03/2025

- E-commerce web development using agile methodology, building the front-end with React and Next. Back-end with Typescript and Express, in addition to other tools like Docker, Postgres, Git, etc.
- Significantly increased company revenue by creating key functionalities, such as selling bicycles that were currently rented. Furthermore, I facilitated and improved sales and rental processes, which included the creation of a new plan model.
- Developed dozens of new functionalities and features to improve workflows, increase security, and facilitate processes for customers, sellers, and system administrators, always maintaining high-quality, well-written, readable, and easily maintainable code.
- Removed bugs through refactoring and the creation of very verbose code, aiming to clearly define how the system should function and ensure that business rules are applied.
- Resolved many security issues in the project, such as data being returned incorrectly or processes and functionalities with serious errors. I was also responsible for adding identity verification to the system, bringing greater confidence to our sellers.
- Worked very closely with the company director, which enabled me to contribute to the initial planning of new functionalities in the project, taking into account current behavior, practicality, better user experience, and a solid solution that will remain in the system for a long time.
- Worked closely with the support team, making corrections, improving the administration system, answering questions, and collecting feedback whenever necessary.

ASTRA TECHNOLOGIES | 09/2023 - 08/2024

- Worked on 2 projects using agile methodology. One build with React, React Native, SAAS, Redux, etc. Back-end with Python in a serverless application, along with other AWS tools. The other is web-only, and we used Node for the back-end and Next for the front-end; this project is in its initial stage.
- Developed the data backup system using AWS services such as Dynamo, S3, SQS, and Lambdas. Analyzing data structures, service costs, and optimizing queries with indexes.
- Helped improve and enhance the high code standardization we have in the system, where the code does not bear anyone's mark. The high code standardization helped us immensely increase demand delivery, both in development speed and in the number of sequential feature approvals without the need for corrections.
- To achieve a high delivery quantity, high code quality is also necessary. I achieved this by identifying development standards, business rules, how administrators (Superior Industries) and clients used the system, that is, understanding the domain of the application (DDD). This helps build more maintainable, semantic, and performant software.
- I also applied my domain knowledge by creating semantic tests developed with TDD.
- Developed hundreds of tests for our lambdas, often testing large lambdas that involved a significant amount of data and complexity, which really took me to another level in test creation and development.
- Developed a very important integration/feature in the company's V2 system that was presented at a technology fair.
- In this company, effective communication is necessary; we have presentations a few times a year, and I presented once.

INSPECTO AGRI | 05/2022 - 09/2023

- Web development using agile methodology, building front-end with HTML, CSS, JavaScript, and jQuery. Back-end with Python, using the frameworks Django and Django Rest Framework, along with other tools like Docker, Postgres, Git, etc.
- I joined the company when the system was in a very early stage and was able to develop features that helped bring in dozens of clients, as well as improve, refactor, and maintain existing features.
- Worked on integrating with various third-party systems to create features. For this, I was responsible for designing the functionality from start to finish, creating domains, objects, protocols, workflows, and data structures, as well as how the layout would be designed based on this, considering the user's experience and needs. Some integrations required meetings with external companies.
- With the arrival of new clients, I worked on some mass data migrations, handling over 20,000 records. Some clients had an enormous amount of data, so I adapted several components to work with pagination, such as selects, tables, and Kanban, using pure JavaScript which required more complex logic. I also created and optimized dozens of queries on the back-end.
- For large features, I coordinated a team, creating, assigning, and assisting with tasks, always in a friendly environment where everyone was aware of the client's needs, and consistently presenting results, planning, and showing next steps to the superior.
- Dealt with extremely complex domains, large data structures, many entities, laws, and much more, needing to learn from domain experts within my company and others. This was extremely important for my professional development and knowledge in DDD.

FREENLANCER PROJECT | 12/2021 - 03/2022

Development of software to manage the registration of clients and plans for a company in the funeral sector, with optimized registration for salespeople who had to collect dozens of pieces of information. Using technologies such as Django, Html, Css, Javascript and Python. The site is hosted on Heroku and has a personalized domain.

PERSONAL PROJECTS | 07/2018 - PRESENT

I create projects to improve my programming skills. I learn knowledge from books, channels, articles and courses, and apply it to my personal projects which are available on my Github profile and in my portfolio. I recently created my own startup.

EDUCATION

ESTÁCIO | 08/2021

Bachelor's degree in Computer Science

INSTITUTO FEDERAL DO MARANHÃO | 04/2018 - 05/2021

Degree in Industrial Automation

CERTIFICATES

IGNITE ROCKETSEAT | REACT AND NEXT

HASHTAG PYTHON COURSE

AWS COURSE AT UDEMY
